# INTRODUCTION

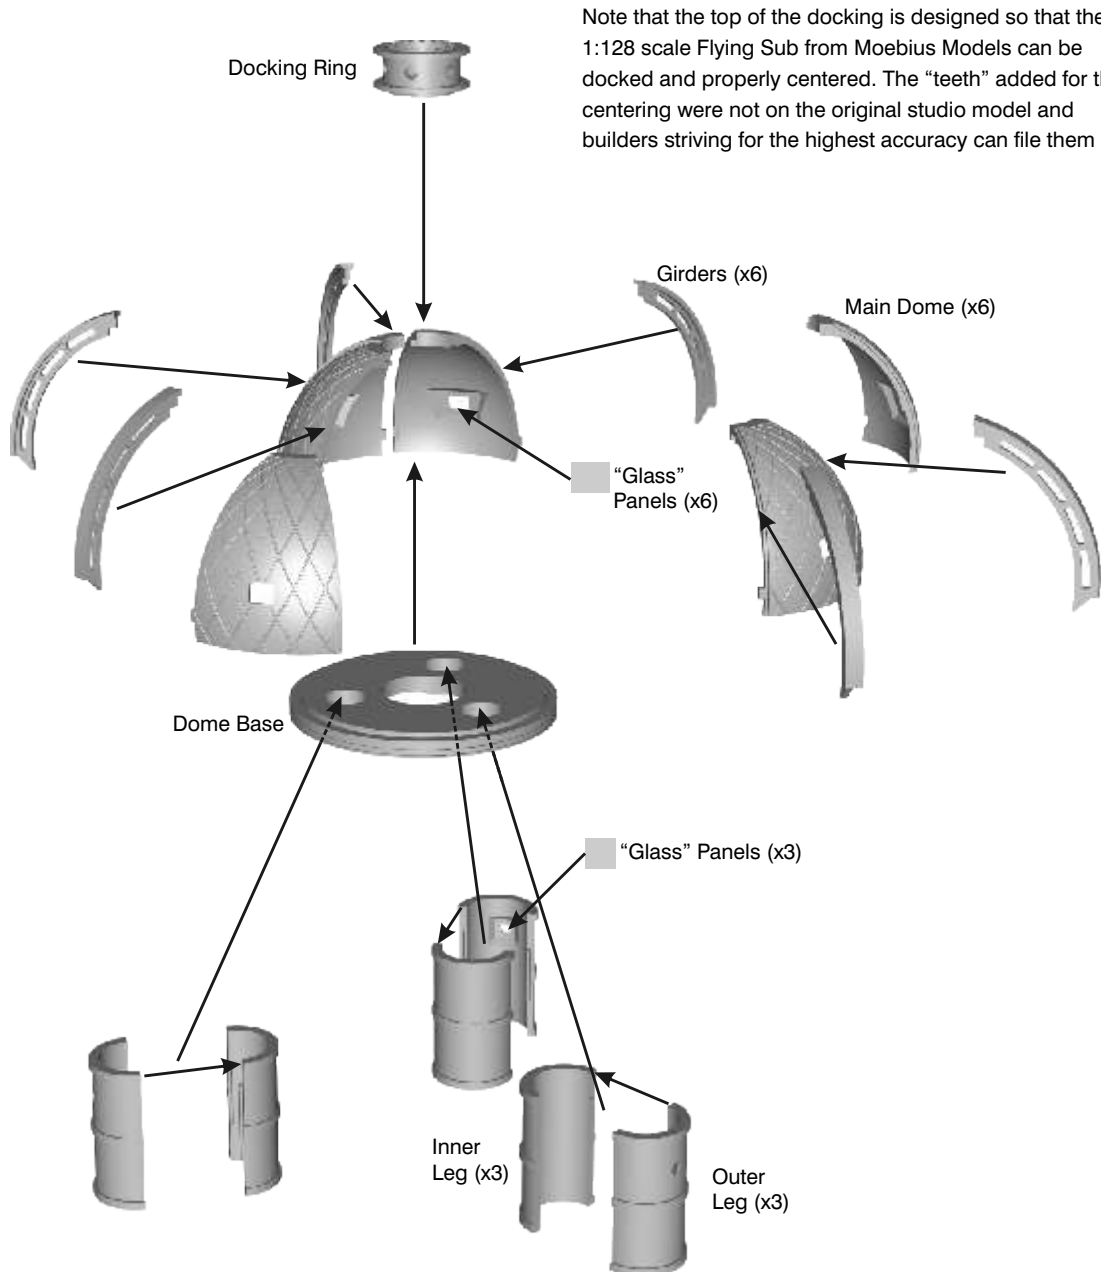

Thank you for purchasing ParaGrafix's "Deep Sea Lab" from Irwin Allen's classic series "Voyage to the Bottom of the Sea". This precision cast replica can be assembled by any modeler of average ability.

We suggest super glue (AKA cyanoacrylate or CA) or epoxy cement for assembling the main structure. Microscale Industries' Micro Krystal Klear is ideal for attaching the frosted "glass" panels.

## Assembly

Cement the pieces together as shown. Attach the Main Dome parts to Dome Base, and the Docking Ring to the Main Domes before adding the Girders

You may find it easier to assemble and paint the main dome and leg halves before attaching the frosted glass panels, then complete the remainder of the assembly.

Note that the top of the docking is designed so that the 1:128 scale Flying Sub from Moebius Models can be docked and properly centered. The "teeth" added for this centering were not on the original studio model and builders striving for the highest accuracy can file them off.

**TIP:** Easy LED from ParaGrafix is an ideal way to easily light the interior of the main dome and legs. The 30 cm Warm White Easy LED (p/n PGX158-0.3) works great to give the warm light of incandescent lamps.
